### 1. Bayesian Networks: d-separation

---

As discussed in class, conditional independence properties entailed by a Bayesian Network can be read directly from the graph, using the notion of *d-separation*. Given the Bayesian network in Figure 1, which of the following conditional independence statements hold:

Figure 1: Bayes' net for Problem 1

1.  $A \perp F$
2.  $A \perp G$
3.  $B \perp I \mid F$
4.  $D \perp J \mid G, H$
5.  $I \perp B \mid H$
6.  $J \perp D$
7.  $I \perp C \mid H, F$

### 2. Bayesian Networks: Variable elimination

---

Suppose you wish to do variable elimination on the Bayesian Network in Figure 1. Consider the variable ordering  $A, B, C, D, E, F, G, H, I, J$ . For each iteration of the algorithm (i.e., for each of the variables), determine which factors are removed and introduced. As an example, in the first iteration (variable  $A$ ), the factor  $P(A)$  and  $P(B \mid A)$  are removed, and replaced by a new factor  $g_1(B)$ .

### 3. An algorithm for d-separation

---

In this exercise, you will implement an algorithm for computing d-separation of variables in Bayesian networks. In fact, the algorithm works in the opposite way by finding all variables that are *not* d-separated from a variable of interest. More formally, given a query variable  $X$  and a set of observed variables  $\mathcal{Y} = \{Y_1, \dots, Y_n\}$ , the algorithm decides which variables could be dependent on  $X$  given  $\mathcal{Y}$ , that is, it returns the set of reachable variables

$$\mathcal{R}(X \mid \mathcal{Y}) = \{Z \mid Z \notin \text{d-sep}(X; Z \mid \mathcal{Y})\}.$$

You are provided some skeleton Python code in the .zip file accompanying this document. Take the following steps for this exercise.

1. Install the Python dependencies listed in `README.txt`, if your system does not already satisfy them. After that, you should be able to run `demo.py` and produce some plots, albeit wrong ones for now.
2. Implement the missing code in `core.py` marked with `TODO`.
3. If your implementation is correct, you should get correct results for the v-structure of the demo file. You can try out more example networks from `examples_dsep.py` to test your implementation.
4. Now, create the network shown in [Figure 2](#) and answer the following questions:
  - (a) Which variables are reachable from Radio, if nothing is observed?
  - (b) Which variables are reachable from Radio, if Phone is observed?
  - (c) Which variables are reachable from Radio, if both Phone and Earthquake are observed?

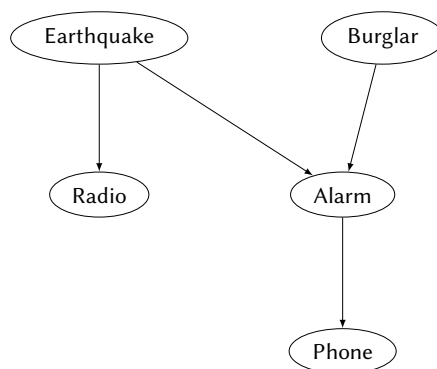

Figure 2: The earthquake network to be implemented.
